Requester's Full Name: RICHARD W. HESS Examiner #: 77148 Date: 8/14/2000
 Art Unit: 2764 Phone Number 308-6287 Serial Number: 09/190,727
 Mail Box Location: _____ Results Format Preferred (circle) PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need.

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: DISTRIBUTED NETWORK BASED ELECTRONIC WALLET

Inventors (please provide full names): SEE ATTACHED PALM PRINTOUT

Earliest Priority Filing Date: 11/12/1997 NEED BY 01/20/2000

For Sequence Searches Only Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

BASIC PRIOR ART SEARCH:

INVENTOR SEARCH

ASSIGNEE: (SEE ATTACHED PALM PRINTOUT)

KEY CONCEPT: ELECTRONIC WALLET THAT CONTAINS INFORMATION SEGREGATED INTO 3 DATA STORAGE CATEGORIES:

- ① FIRST DATA STORE / STATIC IDENTIFICATION DATA / COURTESY ACCOUNT
contains data normally used to establish a business relationship i.e. name address, SS# etc. (relatively small amount of data)
- ② Second Data Store / moderately dynamic Personal Data / Service Account
- large volume of data stored primarily for the convenience of the consumer i.e. billing history, payment history, loans, real estate etc
- ③ THIRD DATA STORE / Dynamic Demographic Information / Value generation account
- Data that is available to be mined from the above two data sets or is specifically provided by the consumer. Data could be sold, used for surveys, polls etc.

(Copy of abstract & claims attached)

Richard:

Attached is the search you requested on electronic wallets containing three separate storage areas for different types of data. Mondex and Fujitsu both hold patents that appear to be very close to the system described in your application.

Please let me know if you would like to refocus or modify the search in any way.

Ellen

Abstract (Basic): JP 11238107 A

NOVELTY - An output unit (9) obtains the result of the comparison between the outputs of an attribute data comparison unit (4) and a three-dimensional data comparison unit, in which both data are considered as identifying data. The three-dimensional data comparison unit compares three-dimensional data input by a three-dimensional data input unit (1). DETAILED DESCRIPTION - The attribute data comparison unit compares attribute data input by an attribute data input unit (2), and stores the attribute data to a data **storage** unit (5) along with the **three** -dimensional data. The three-dimensional data comparison unit has a characteristic data extractor (3), a characteristic comparator (6), and a characteristic data-reader (7). An INDEPENDENT CLAIM is also included for the data recording medium.

USE - For personal data card e.g. **electronic money** card, personnel management card, member card, medical-examination card, credit card.

ADVANTAGE - Offers prevention against e.g. forgery, counterfeit. Ensures accurate distinguishing of e.g. person and name of image.

Improves reliability of comparison judging system. Allows stabilized utilization of data, even after years have passed. DESCRIPTION OF

DRAWING(S) - The figure shows the block diagram of the comparison judging system. (1) Three-dimensional data input unit; (2) Attribute data input unit; (3) Characteristic data extractor; (4) Attribute data comparison unit; (5) Data storage unit; (6) Characteristic comparator; (7) Characteristic data-reader; (9) Output unit.

EP 945833 A2 E 18

Designated States (Regional): AL AT BE CH CY DE DK ES FI FR GB GR IE IT
LI LT LU LV MC MK NL PT RO SE SI

Abstract (Basic): EP 945833 A2

NOVELTY - **Electronic money** is stored in the integrated chip module transactional memory of the smart card of the customer. When the customer makes a purchase the cost is deducted from this value and

transferred to the merchant. The transaction is then recorded in the transactional memory of the card. The transaction record is then transferred to a n historical record in the smart card. The card is inserted into an on-line teller machine where it can upload the account changes to the bank remotely.

USE - For remote banking using smart cards with **multiple** technology **memory** capabilities.

ADVANTAGE - Card storage is periodically refreshed so can cope with large amounts of transaction data without running out of memory space.

DESCRIPTION OF DRAWING(S) - The drawing shows a flow diagram of the smart card's operation.

JP 11120300 A 42

Abstract (Basic): EP 908855 A2

NOVELTY - An area (2) for the operation of a CPU (3) is restrictively preset in the card memory at a time of execution of a program for realizing one application function, e.g. medical information storage, thereby preventing data to be managed by other applications, e.g. **electronic money**, being fetched.

DETAILED DESCRIPTION - An area monitoring mechanism (6) takes, as input, information of an area having access during program execution in the CPU (3), and monitors whether or not the processing in the CPU is being performed in the area extracted by the area control mechanism.

INDEPENDENT CLAIMS are included for a method for managing a memory space of a portable card medium, a method for issuing a portable card medium and a method for writing program data on a portable card medium.

USE - For **multi**-purpose data **storage** on card; e.g. storing **electronic money** issued by ATM machine and medical information pertaining to card holder.

ADVANTAGE - Provides increased security to avoid data that is to be managed by one program, e.g. **electronic money**, being accessed by another program, e.g. medical information program.

DESCRIPTION OF DRAWING(S) - The figure shows a block diagram of the portable card medium.

Abstract (Basic): EP 917119 A

NOVELTY - The system has a server with data storage for storing personal data in **three separate and distinct data stores**. A first **data store** is **stored** on the **data storage** comprising static identification data which is personal to a user having access to connect to the server. A second data store is stored on the data storage company moderately dynamic personal data about the user. A **third data store** **stored** on the **data storage** comprises dynamic demographic information data about the user.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is included for a method of selectively organizing, accessing and using personal data.

USE - For selectively organizing and accessing personal data, e.g. network

based **electronic wallet**, for preserving consumer personal information.

ADVANTAGE - Enables personal information to be backed, thus protecting against mishap, natural disaster, negligence or PC-theft

whilst providing safe and secure store, which can securely exchange information.

DETAILS OF DRAWING(S) - The figure shows a general overview of the system

Patent Details:

Patent	Kind	Lan	Pg	Filing	Notes	Application	Patent
JP 10340231	A		19				

Abstract (Basic): JP 10340231 A

NOVELTY - **Several memory units (17a-17z) to store different data** and an isolation memory (18) to store classified data are provided in a card (1). Access to all memory units is possible only by input of passwords through keys (12,13). A microcomputer (16) checks for the password authenticity by comparing input password with the password stored in a memory unit (22). Access of the isolation memory (18) by computer, which is controlled using access control unit is possible only when access demand is received from card reader/writer, and after verification of access right by computer.

USE - In identity card of credit card, money card.

ADVANTAGE - Since memory access is possible only after verifying the password, secrecy of important data is maintained. Since data in isolation memory is accessed only when access demand is received from card reader/writer security function of secret data in isolation memory is further improved. DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of the internal arrangement of the identification card.

(1) Identification card; (16) Micro computer; (17a-17z) Memory unit; (18) Isolation memory; (22) Password memory unit.

Abstract (Basic): GB 2327661 A

NOVELTY - The container has two interchangeable unit, with the lower one (3) being a storage unit and the upper one (2) being a bottle for holding liquid. The screw-fitted combination of the units forms an extended container. The lower unit can also act as a cup if required. The bottle may be detached from the **storage** unit and be used totally **separately** as a drinking bottle on its own.

USE - Combined storage and drinks bottle container for use when exercising e.g. cycling or working out in gym.

ADVANTAGE - Provides convenient apparatus for carrying small items e.g. keys, **money** and cards, in addition to water for drinking during exercise.

DESCRIPTION OF DRAWING(S) - The drawing shows a partial view showing the screw fitting of the top, bottle and base storage unit.

- 1 top
 - 2 upper unit (bottle)
 - 3 lower unit

Designated States (Regional): AL AT BE CH CY DE DK ES FI FR GB GR IE IT
LI LT LU LV MC MK NL PT RO SE SI

JP 11025003 A 26

Abstract (Basic): EP 890931 A

The method involves using memory for storing information in block units. The memory has a data region for storing data in these block units and two regions for storing several block numbers which are assigned to particular blocks in the data region.

Data is written to a block of the data region. The block number to which data was written is stored in the other region. When data is to

then be rewritten to that block e.g. in order to update that data, this new data is written to a block with a different number. Only when writing is completed successively is the old data then erased from the old block.

USE - In IC card or similar which performs transmitting and receiving of data e.g. **electronic money** whereby on each purchase the balance stored in card must be updated.

ADVANTAGE - Ensures stable reading of data is always possible e.g. if power failure occurs during write process update data will be corrupted, but allows old data to be retrieved, using stored old block number, this data having not been written over with new update data.

AU 9877768	A	Based on	WO 9852159
------------	---	----------	------------

Abstract (Basic): WO 9852159 A

The integrated circuit card contains multiple applications, e.g. **electronic purse**, frequent flyer discount, credit card. Only one application can be run at any instant and the initial application is selected via the operating terminal. The card runs an operating system that manages **memory** allocation. The **memory** is **divided** into static **memory** holding common values, e.g. owner identity, dynamic temporary application memory and public or shared memory. Memory access is constrained by registers.

If an application invokes another application, the dynamic memory of the first is saved and it can exchange data via public memory. When the application is restored its dynamic memory is restored.

ADVANTAGE - ADVANTAGE - Allows applications to interact while maintaining security by protecting private application data.

JP 11031190 A 12

Abstract (Basic): EP 878784 A

The card comprises a central processing unit (CPU) (202) and a non volatile memory (205), the non volatile memory **stores data** of the **electronic money**, **several** pieces of identification data to

identify usages to be specified when the **electronic money** card is used, and usable limit data limits an amount of **electronic money** to be used in correspondence with each piece of identification data. The CPU compares a piece of identification data received from outside the **electronic money** card with each of the pieces of identification data stored in the non volatile memory upon request payment and permits the payment in **electronic money** within the usable limit of the **electronic money** limited by the piece of identification data when the compared pieces of identification data coincide with each other.

The non volatile memory stores a password set to correspond to a piece of identification data, and the CPU permits payment in **electronic money** when a password received from outside the **electronic money** card coincides with the password stored in the non volatile memory.

ADVANTAGE - Stores usable limits of **electronic money** and passwords on user or usage basis and stores transaction record including items indicating users and usages.

Abstract (Basic): EP 872816 A

The card unit processing apparatus is for use with a card unit (2) with a storage unit (2a) to conduct processes on the card unit. The processing apparatus includes a communicating unit (3) which communicates with the card unit. A display unit (4) displays data which includes data read out from the storage unit of the card unit via the communicating unit. A control unit (5) conducts control operations which include a display state control of the display unit and a data reading/writing control of the storage unit of the card unit.

A power source unit (6) supplies electric power to the communicating unit, the display unit (4) and the control unit (5). A first key (7) is pressed to select a processing function performed on the card unit. A second key (8) is pressed to select detailed data which relate to the function selected by presses the first key. A third

key (9) is pressed to determine the data selected by pressing the first and second keys.

ADVANTAGE - Increases number of functions without increasing number of parts.

Patent Details:

Patent	Kind	Lan	Pg	Filing Notes	Application	Patent
JP 10228515	A		9			

Abstract (Basic): JP 10228515 A

The electronic cash holder includes **several** cash **storage** unit (2,7) which is provided in an **electronic** **wallet** (1). A code input unit is provided through which code is input. The cash stored in predetermined cash storage unit is transferred to an external cash receiver based on the predetermined code input through the code input unit.

ADVANTAGE - Facilitates to limit maximum transfer amount to amount of cash stored by selected cash storage unit thereby prevents transfer of total amount stored by electronic cash holder.

Patent Details:

Patent	Kind	Lan	Pg	Filing Notes	Application	Patent
--------	------	-----	----	--------------	-------------	--------

Abstract (Basic): JP 10111896 A

The card (ED) has a non-volatile **memory** area. The **memory** area stores **multiple** groups of password having two in one group.

The memory area rewrites the password according to the requirement and it monitors the password. When the card corresponds to the first password according to the input signal, a control circuit performs calculation process of the second password and is then output.

USE - In e.g. **electronic money**.

ADVANTAGE - Offers high security during commercial transaction. Improves degrees of freedom of design.

Patent Details:

Patent	Kind	Ian	Pg	Filing	Notes	Application	Patent
JP 9091541	A		20				

Abstract (Basic): JP 9091541 A

The machine (1) includes a RAM (14) which consists of **multiple memory** units. The setting data corresponding to each goods recognition information received from a partner registration machine, is stored temporarily in a buffer (57) of the RAM. The setting data is then stored into a first memory unit (54) responding to the predefined number of figures. The judgment of the number of figures of setting data is performed.

When the number of figures are lesser than that the predefined number then the setting data is stored into the first memory unit. When the number of figures exceed the predefined number, then the predefined number of figures of the setting data is stored into the first memory unit and the remaining excess number of figures are stored into a over data buffer (59) of the RAM.

ADVANTAGE - Enables to perform retouch of setting data pertinently, efficiently and accurately.

Abstract (Basic): WO 9117528 A

The data transfer unit communicates data between a first 'smart' card, carrying a microprocessor, and a second card which stores data in semiconductor memory or on a magnetic medium. Connectors are provided for input cards, and write units for the output cards. The front of the unit has a display (7) and a touch panel (8), both managed by a microprocessor.

The microcircuit card contains all the identification, control and management data of the interface and transaction circuit.

USE - Pocket-size unit for communication from master smart cards to secondary card or data terminal in e.g. **electronic money** transfer, home automation and customised microcircuit cards. (64pp DWg.No.1/23)

Abstract (Equivalent): EP 527203 B

A method for effecting a transaction between at least one first plug-in data carrier (5;186;296) incorporating a microcircuit, said carrier being of the type commonly referred to as an IC memory card or a microprocessor card, and at least one second data carrier, comprising at least the steps of setting up a relation between said carriers, reading said first carrier, identifying the compatibility of said first carrier with the second carrier and transferring data from one of said carriers to the other during a transaction between said first and second carriers via an interfacing circuit (11), characterised in that it comprises the use for said first data carrier of a microcircuit carrier (5;186;296) which contains all necessary data for carrying out identification and for controlling and managing said interfacing circuit (11) and said transaction.

Dwg.1/23

Abstract (Equivalent): US 5434395 A

The plug-in data carrier includes a processor, a program memory connected to the processor, and a dedicated memory connected to the processor. The dedicated **memory** is **divided** into a number of regions including a region for controlling and managing the operation of a transaction device, which is a device independent of the plug-in data carrier. The transaction device includes a first contact section which establishes electrical contact with the plug-in data carrier, a second contact section which establishes electrical contact with another data carrier, a first memory section inputting and outputting data to the plug-in data carrier via the first contact section, a second memory section inputting and outputting data to the another data carrier via the second contact section, and an interfacing circuit.

The interfacing circuit identifies, under control of the plug-in data carrier, whether the another data carrier is compatible with the plug-in data carrier, and controls data transfer between the plug-in data carrier and the another data carrier via the first and second memory sections under overall control of the plug-in data carrier when the another data carrier is identified as compatible with the plug-in data carrier.

USE/ADVANTAGE - For smart card. Allows intelligence of complex server to be incorporated in microcircuit card.

ES 2066169	T3			Based on		EP 423035	

Abstract (Basic): EP 423035 A

The cash card's **memory** chip is **divided** into at least four **memory** zones. The zones include an identity area (3) for the card or bearer; a zone holding the cash balance remaining (6); a transaction counter (5) and an encrypted key (4).

The microprocessor (8) in each reader (2) is associated with a DES encryption algorithm (12) which calculates the value of the key to ensure it matches the stored value. It then recalculates, encrypts and stores a new value which is a function of the stored identity, the value of the counter (number of transactions) and the new balance.

USE/ADVANTAGE - By bank. Cost is kept to minimum by using memory chips in cards instead of microprocessors and security is preserved by performing all processing in card reader terminals. (9pp Dwg.No.1/2

Abstract (Equivalent): EP 423035 B

Payment system using an electronic memory card as a wallet, comprising memory cards (1) as wallets and one or more interaction terminals (2) to interact on financial balances recorded in these cards, the said memory cards comprising an identity memory zone (3) and a balance memory zone (6), the system comprising means for modifying, in the course of the interaction, the balance recorded in the balance zone, characterised in that these memory cards comprise at least two other different memory zones; an interaction counter zone (5) and a certificate zone (4), in that the terminals comprise means before each interaction, for preparing a signature from the balance recorded in the balance zone, on the basis of the contents of the counter and on the basis of the identity recorded in the identity zone, verifying that this signature corresponds to a certificate recorded in the certificate zone, and in that this system also comprises means for, each interaction, incrementing the contents of the interaction counter, preparing a new signature as a function of the modified balance of the new contents of the interaction counter and of the identity, and recording the new signature as a new certificate in the memory card.

Dwg.1/2

Abstract (Equivalent): US 5191193 A

The system of payment by **electronic** memory **money** cards. involves memory cards with at least four different memorising zones an identity zone, a balance zone, an interaction counter zone and a certificate zone. The terminals used during financial transactions include devices designed. A signature is prepared from the balance, the content of the counter, and the identity. The signature is checked by comparison to a certificate recorded in the certificate zone. At each interaction the balance can be modified, the content of the interaction counter can be incremented or a new signature prepared as a function of the new balance. The new content of the interaction counter and the identity. The new signature can be recorded as a new certificate in the certificate zone.

The interaction terminals can prepare a new signature by application of a DES type algorithm. The terminals can transmit to a data service centre, an identity of the memory cards for which the verification of the signature has not corresponded beforehand in the certificate zone.

ADVANTAGE -Card does not necessarily have microprocessor so cost reduced but same level of security as microprocessor-based cards.

Abstract (Basic): EP 276597 A

Procedure for counting/counting down in particular for fiduciary currency, by means of operations applied to a **memory** space, this **memory** space being **divided** into two zones of the same capacity, one known as the payment zone (ZP), the other known as the reloading zone (ZR), these zones being initially loaded with bits which are in a first logic state designated 1 and are capable of being put in a second logic state designated 0, the bits having, in these two zones, a given rank, a bit x in the first zone being said to be homologous with a bit y in

the second zone, if they have the same rank, these two bits then defining a pair (x,y), pairs (1,1), (1,0), (0,1) and (0,0) being capable thus of being written in the memory, such a procedure consisting in: simulating a debit operation by creating a pair (0,1), possibly by creating a pair (1,0) in order to simulate a stop beyond which it is not possible to write pairs simulating a debit, and in creating pairs (0,0) in order to cancel previous debit operations or stops, considering that the content (or balance) available in this memory space is equal to the number of pairs (1,1), the rank of which is superior or equal to 1 or to the rank of the pair (0,1) of highest rank which simulates the last debit operation when such a pair (0,1) exists, and inferior to the rank of the stop pair (1,0) if such a stop exists or to the last pair (1,1) of the memory, simulating a credit operation by gating bits in the reloading zone in order to cancel previous debit operations by making the pairs (0,1) pass to the state (0,0), these pairs being ignored subsequently, by cancelling a stop pair (1,0) by gating the bit at 1 of the payment zone in order to make the pair pass

FR 2608297 A

The card operated electronic system for crediting and debiting quantities, most typically money, has two **memories**. These **memories** are each **divided** into two spaces, one representing payments and one representing credits. Depending on the quantities being dealt with, the value of magnitudes in one **memory** is a fixed **multiple** of those in the other.

Initially all the memory spaces contain 1 bits, which can be changed to 0 bits. Within any memory, payment and credit spaces which are adjacent comprise a couple, which can be (0,1) for a debit, (1,0) for a stop or limit (0,0) to erase a previous entry, or (1,1) to establish credit. Magnitudes of payments are indicated by the number of couples from the beginning of a memory up to and including the (0,1) couple, and balances by the number of (1,1) couples between the last debit couple (0,1) and the credit stop (1,0).

USE/ADVANTAGE - Enables high precision to be achieved without use of excessive memory capacity. For **electronic money** debit or credit.

0/13

Abstract (Equivalent): EP 276597 B

Procedure for counting/counting down in particular for fiduciary currency, by means of operations applied to a **memory** space, this **memory** space being **divided** into two zones of the same capacity, one known as the payment zone (ZP), the other known as the reloading zone (ZR), these zones being initially loaded with bits which are in a first logic state designated 1 and are capable of being put in a second logic state designated 0, the bits having, in these two zones, a given rank, a bit x in the first zone being said to be homologous with a bit y in the second zone, if they have the same rank, these two bits then defining a pair (x,y), pairs (1,1), (1,0), (0,1) and (0,0) being capable thus of being written in the memory, such a procedure consisting in: simulating a debit operation by creating a pair (0,1), possibly by creating a pair (1,0) in order to simulate a stop beyond which it is not possible to write pairs simulating a debit, and in creating pairs (0,0) in order to cancel previous debit operations or stops, considering that the content (or balance) available in this memory space is equal to the number of pairs (1,1), the rank of which is superior or equal to 1 or to the rank of the pair (0,1) of highest rank which simulates the last debit operation when such a pair (0,1) exists, and inferior to the rank of the stop pair (1,0) if such a stop exists or to the last pair (1,1) of the memory, simulating a credit operation by gating bits in the reloading zone in order to cancel previous debit operations by making the pairs (0,1) pass to the state (0,0), these pairs being ignored subsequently, by cancelling a stop pair (1,0) by gating the bit at 1 of the payment zone in order to make the pair pass

ABSTRACT

PROBLEM TO BE SOLVED: To provide a durable and highly reliable electronic cashbox which can easily deal with changes cipher processing for the security of **electronic money**.

SOLUTION: A nonvolatile **memory** 100 includes **plural** IC card **storages** 110 corresponding to IC cards which store electronic cash whose currency value are shown in electronic information. A command control part 98 executes in parallel the commands to each part of the storages 110 is the memory 100 and logically realizes control functions of IC cards. When one or plural commands are received from a host device (money server), a communication control part 50 forms parallel communication paths corresponding to the number of commands with the part 98 and logically realizes communication functions with the storages 110.

ABSTRACT

PROBLEM TO BE SOLVED: To link plural applications included in an IC card by selecting an application that corresponds to selected **data** among **plural stored** applications.

SOLUTION: A citizen card 1 stores various applications 100 which are offered by plural card/application issuers who have various business forms. The card 1 is provided with two communicating means. One of them is a communicating means which sticks a reader/writer and the card 1 together to surely perform authentication in **electronic money** and a medical system 2300, and the other is a communicating means which can perform communication with the reader/writer and the card 1 separated because the speed is regarded as important. A selecting means selects one of the communicating means, and a controlling means selects an application that corresponds to data from the selected communicating means and starts the application.

ABSTRACT

PROBLEM TO BE SOLVED: To improve convenience in the case of using **electronic money** by managing the **electronic money** while classifying it by purposes of use by distributedly storing the **electronic money** in **plural storage** areas corresponding to the purpose of use as designated and executing payment in the **electronic money** stored in the storage area while designating the desired storage area.

SOLUTION: A storage part 300 is provided with a **storage** part 310 composed of **plural storage** areas 301-1 to 301-N and stores the **electronic money** and various kinds of additional information while classifying them by the purpose of use concerning one kind of currency. A distributed **electronic money storage** control part 100 sets the **plural storage** areas 301 defined by purposes of use in the storage part 300 and distributedly stores the **electronic money** in the **plural storage** areas 301 corresponding to the purposes of use as designated. An **electronic money** payment executing part 200 designates the desired storage area 301 among the storage areas 301 concerning the **electronic money** owned in the storage part 300 and executes the payment in the **electronic money** stored in this designated storage area 301.

FILED: September 29, 1997 (19970929)

ABSTRACT

PROBLEM TO BE SOLVED: To efficiently perform read processing, including even the time when an error occurs by using the memory unit having nonvolatile semiconductor memory to store sales data of such as an **electronic money** registering device.

SOLUTION: An memory area (20) of this nonvolatile semiconductor **memory** is **divided** into 1st and 2nd areas (21) and (22). Sales data are successively written in data records 31a to 31e from a leading address of the area (21). Flags that show whether or not respective sales data writing is normally performed are written in flag areas 31af to 31ef. Sales data 'C' and 'E' in which a write error occurs are successively and newly written in the data records 32c and 32e from a leading address of the area (22). Because the data records 31a, 31b and 31d where no write error occurs can sequentially be read from the leading address of the area (21), data read can effectively be performed.

PRIORITY: 09122514 [JP 979122514], JP (Japan), May 13, 1997 (19970513)

ABSTRACT

PROBLEM TO BE SOLVED: To permit plural users to share one **electronic money** card by comparing **plural** pieces of identification **data stored** and use limit amount data with identification data received from outside by a control part and permitting payment within the range of a use limit amount when they are matched.

SOLUTION: A non-volatile memory 205 has individual ID 211 at every user, use target identification codes 215 and 219, identification numbers 212, 216 and 220 by individual use targets, and a storage area (payment condition 209) recording use limit amounts 213, 217 and 221 showing an upper limit for extracting **electronic money**. CPU 202 compares individual ID identifying the user, and the input of the use target of **electronic money** with individual ID 211 in the payment condition 208 and use target identification codes 215 and 219. Thus, the justness of data is judged. When the identification numbers 212, 216 and 220 are normal, the payment of **electronic money** 208 is permitted within the range or the conditions 213, 217 and 221 of the limit amount corresponding to the use target.

ABSTRACT

PROBLEM TO BE SOLVED: To prevent all the amount of electronic cash held in an electronic cash holder from being moved even when the move of electronic cash is forced by making an electronic cash storage part, in which the electronic cash is stored, selectable corresponding to a password to be inputted.

SOLUTION: An **electronic purse** A1 is provided with **plural** electronic cash **storage** parts as shown as electronic cash storage parts A2 and C7. A control part 8 requests the input of password number to an owner and allows the move of electronic cash from the **electronic purse** A1 on the condition that a password number inputted from a data input part 4 is coincident with one stored in a password storage part 3. The password number **storage** part 3 can store **plural** password numbers and the respective password numbers are made correspondent to respective **plural** electronic cash **storage** parts. When the inputted password number is coincident with one of password numbers stored in the password number storage part 3, the electronic cash storage part corresponding to that password number is selected.

Abstract (Basic): EP 917120 A

NOVELTY - The virtual wallet system has a locally residing wallet portion, an external server residing wallet portion and an interface between the locally residing wallet portion and the external server residing portion. The wallet may have a payment mechanism, an identity authentication mechanism, personal information, and electronic artifacts.

DETAILED DESCRIPTION - The payment mechanisms comprise one or more of the following; bank account information, credit account information, electronic currency, electronic checks and debit cards.

USE - For information and financial banking including payment mechanisms, identity authentication mechanisms, personal information, and electronic artifacts.

ADVANTAGE - Does not require network connection to access wallet whilst providing compatibility with browsers. May include information from a variety of sources. Provides convenient way to move information around.

DETAILS OF DRAWING(S)- The figure shows a schematic representation of the virtual wallet.

ABSTRACT

PROBLEM TO BE SOLVED: To safely and correctly execute authorized information transfer in a reliable state while maintaining personal privacy.

SOLUTION: A 1st data storage 31 includes static personal identification data related to a user 25. A 2nd data storage 33 includes properly dynamic personal data related to the user 25. A 3rd data storage 35 includes dynamic and actual population statistic information data related to the user 25. In the above system, a selected part of data is downloaded to allow the user 25 to use it with an electronic wallet. The data can be used so that a form is embedded, services are provided to the user 25 and a storekeeper can selectively determine the user 25 to whom commodities are to be sold while maintaining the anonymousness of the user 25.

ABSTRACT

PROBLEM TO BE SOLVED: To obtain a device for storing information and money by providing the device with an interface between a locally resident wallet part and a wallet part residing in an external server.

SOLUTION: A virtual wallet system is provided with a hybrid between a wallet 2 kept by an owner close at hand and a wallet arranged on a remote place together with a server 4 or the like. Namely the system includes the interface between the local function 2 and the server 4 and interacts with an external world 8 through the wallet 2 and/or the server 4. Thus the system is provided with the locally resident part and the part residing in the server 4 and these two wallet parts can be communicated with each other through the interface 6. Thus information including a payment mechanism, a personal identification mechanism, personal information, and an electronic artifact and money can be stored.

...SPECIFICATION and personal data on a single card.

SUMMARY OF THE INVENTION

According to the present invention, a system and use for personal banking with a **multi -memory** technology smart card is disclosed. The present invention provides a system for using a card having sufficient memory capability to perform everyday transactions using **electronic purses** , as well as storing personal information, account information, medical information, etc. The card preferably comprises an optical stripe memory integrated with a smart card integrated...

...the optical stripe is used for storing large amounts of information. Thus, the system of the present invention allows a customer to rely on the **multi -memory** technology card for storing and manipulating data and performing transactions.

It is an advantage of the present invention to provide a method of using a...12 is relatively limited in its storage capacity compared to the large capacity memory 13, the chip memory is still capable of performing as an **electronic purse** 35 that can be used to store cash value for use in cash transactions. For example, the chip memory 12 may contain an **electronic purse** 35 that can be used to make purchases at businesses in the same manner that a credit card or ATM (Automated Teller Machine) card would...

...terminal (described below) that is off-line or on-line including over the Internet. An advantage of the present invention is the ability of the **multi -memory** technology card to utilize the internal security

mechanism found in the encryption application 20 of the chip memory 12 to protect communications in any one or all of the **memories** of the **multi-memory** technology card 10.

The encrypted communications 30 in the memories may be accessed, manipulated and stored by using any of a variety of input terminals... high net worth such as "\$\$\$" or some other established sign. Additionally, or in lieu thereof, the encrypted communication 30 indicating high net worth includes an **electronic purse** 35, showing available cash value, a letter of credit 32 certifying available credit value, or an account hold message. An encrypted communication 30 indicating an...

...the advance and any fees. Further, it may be advantageous to have encrypted communications 30 indicating the identity of an individual attempting to use a **multi-memory** technology card 10, prior to reaching the encrypted communications 30 indicating high net worth.

In an embodiment of the present invention a high value individual...

...ABSTRACT A2

A system and method for securely storing data provides for storing, managing, and updating an owner's secret data and for accessing the

stored data by a trusted **third** party upon the occurrence of an event, such as the death of the owner. The system and method makes use of application software, such as a **virtual wallet** running at least in part on the server of a trusted third party and with a virtual executor function and a virtual archivist function. The...

...the owner's secret device for accessing the stored data. Upon verification of the occurrence of the event, the virtual executor provides access to the **stored data** using the trusted **third** party's access aspect. The virtual archivist function automatically updates technologies related to the stored data.

...SPECIFICATION of the present invention, an embodiment of the present invention provides a system and method for securely storing, managing and updating an owner's secret **data** and accessing the **stored data** by a trusted **third** party upon the occurrence of an event, such as the death of the owner. An embodiment of the present invention makes use of application software, such as a **virtual wallet** application running, for example, at least in part on the owner's personal computer and at least in part on a wallet server of a trusted third party, such as a bank or similar financial institution. The **virtual wallet** application also includes, for example, a virtual executor function and a virtual archivist function.

In an embodiment of the present invention, data is stored for...which is illustrated in the accompanying drawings, the present invention provides a system and method for securely storing, updating and managing an owner's electronic **data** and accessing the **stored data** by a trusted **third** party upon the occurrence of an event, such as the death or incompetence of the owner. Fig. 1 shows schematically an overview of key components...

...components, for an embodiment of the present invention. The system for an embodiment of the present invention makes use of application software, such as a **virtual wallet**, which resides, for example, on one or both of the PC 2 of the owner 4 and a server 6 of a financial institution 8...

...ABSTRACT A2

An **electronic money** storage apparatus includes that an amount of remittance p is determined on a remitting side (1100) and a receiving side (1200; 2101, 2201). A remitting...

...be stored in a transaction fee storage area (2102). The remitting apparatus obtains a sum of p and x , i.e., $p + x$ from an **electronic money storage** area (1131; 2103), **divides** the sum into an amount y to be stored on the remitting side and an amount remained $p + x - y$, stores y in a transaction...

... u to be stored on the receiving side and $p - z$ (2204), stores u in a transaction fee storage area (1232; 2206), and stores remaining **electronic money** $p - z$ in an **electronic money** storage area (1231; 2205), thereby the transaction fee can be collected while retaining anonymity between the remitter and the receiver and usability of **electronic money** in the processing of **electronic money** by use of an IC card or the like.

...SPECIFICATION y to be stored in the first electronic storage apparatus, obtains an amount of $p + x$ (p indicating an amount to be remitted) from the **electronic money** storage means of the first **electronic money storage** apparatus, **divides** the **electronic money** thus obtained into the amount of y calculated and an amount of $p + x - y$, stores y in the storage means, and transmits $p + x - y$ via the data transfer unit to the second **electronic money** storage apparatus.

The second electronic storage apparatus calculates a transaction fee u to be stored in the second electronic money storage apparatus, receives the electronic...

...and the transaction fee.

The arithmetic processing unit 1120 includes a transaction fee calculating unit 1121, an electronic money delivering unit 1122, a transaction fee **storage** unit 1123, an **electronic money dividing** unit 1124, and an **electronic money** remitting unit 1125.

The storage 1130 includes an electronic money storage area 1131 to store therein electronic money and a transaction fee storage area 1132...

...data transfer unit 1300.

The arithmetic processing unit 1220 includes a transaction fee calculating unit 1221, an electronic money storage unit 1222, a transaction fee **storage** unit 1223, an **electronic money dividing** unit 1224, and an **electronic money** receiving unit 1225.

Subsequently, operation of each section of Fig 1 will be described by referring to the flowchart of Fig. 2.

First, the ...transaction fee collecting function, the arithmetic processing unit 1120 may not include the transaction calculating unit 1121, the transaction fee storage unit 1123, and the **electronic money dividing** unit 1124, and the **storage** (1130) may not include the transaction fee storage area 1132.

Next, the receiver's apparatus 1200 receives, by the electronic money receiving unit 1225, electronic...

...the electronic money storage unit 1222, the received amount $p + x - y$ in the electronic money storage area 1231 (step 5205).

In the receiver's **electronic money** storage apparatus 1200, the arithmetic processing unit 1220 does not include the transaction fee collecting unit 1221, the transaction fee storage unit 1223, and the **electronic money dividing** unit 1224 and the **storage** 1230 does not include the transaction fee storage area 1232.

As above, even when only one of the communicating electronic money storage apparatuses includes the...

...CLAIMS therein electronic money; and

a data transfer unit (1300) for connecting the first electronic storage apparatus to the second electronic storage apparatus, wherein:
the first **electronic money** storage apparatus calculates an amount x

of remitter's transaction fee and a transaction fee y to be stored in the first **electronic money** storage apparatus (1100), obtains an amount of $p + x$ (p indicating an amount to be remitted) from the memory means of the first **electronic money storage** apparatus (1100), **divides** the **electronic money** thus obtained into the amount of y calculated and an amount of $p + x - y$ (2104), stores y in the memory means (2105), and transmits $p + x - y$ via the data transfer unit to the second **electronic money** storage apparatus (1200); and wherein

the second electronic money storage apparatus calculates a transaction fee u to be stored in the second electronic money storage...

...to be stored in the first electronic storage apparatus (1100), obtains an amount of $p + x$ (p indicating an amount to be remitted) from the **electronic money** storage means of the first **electronic money storage** apparatus (1100), **divides** the **electronic money** thus obtained into the amount of y calculated and an amount of $p + x - y$ (2104), stores y in the memory means (2105), and transmits $p + x - y$ via the data transfer unit to the second **electronic money** storage apparatus (1200).

5. A system for transferring electronic money, comprising:
a first electronic money storage apparatus (1100) on an electronic money remitting side including...

...1121) for calculating an amount remitter's transaction fee and a transaction fee to be stored in the electronic storage apparatus;
means (1122) for obtaining **electronic money** having an amount including an amount to be remitted and the remitter's transaction fee from the **electronic money storage** means;
means (1124) for **dividing** the **electronic money** thus obtained into the amount to be remitted and the amount of transaction fee to be stored;
means (1123) for storing in the storage means...

...ABSTRACT A2

In a non-volatile **memory** are arranged a **plurality** of IC card **storage** units corresponding to a **plurality** of IC cards (32) each storing therein an **electronic money** representing the value of currency in the form of electronic information. A command control unit executes concurrently commands imparted to the **plurality** of IC card **storage** units (10) arranged in the non-volatile memory to logically implement a control function of the plurality of IC cards. In addition, upon a receipt...

...concurrently communication paths corresponding in numbers to the commands and associated with the command control unit to logically implement a function of communication with the **plurality** of IC card **storage** units.

...SPECIFICATION provided an electronic money safe capable of simply dealing with a change in cryptographic processing and capable of fully ensuring a reliability and durability.

The **electronic money** safe of the present invention comprises a non-volatile memory, a command control unit and a communication control unit. In the non-volatile **memory** are arranged a **plurality** of IC card **storage** units corresponding to a **plurality** of IC cards storing therein **electronic money** representative of a currency value in the form of electronic information. The command control unit executes concurrently commands imparted to the **plurality** of IC card **storage** units arranged in the non-volatile memory to thereby logically implement a function of control of a plurality of IC cards. Upon a receipt of...

...memory in this manner, an easy change is achieved in the case of change in cryptographic processing for use in securing the security of the **electronic money**, without any need for a replacement work of a multiplicity of physical IC cards.

The non-volatile memory is comprised of a memory backed up...4801 and 48-2 for LAN.

Fig. 4 illustrates a circuit block of the tray 12-1 representative of the seven trays stored in the **electronic money** safe 10 of Fig. 3. The tray 12-1 includes dualized communication control units 50-1 and 50-2 and tripled value control units 60...parameter (k) it performs a conversion from 1028-bit data x to data y on the basis of This cryptographic processing prevents duplication of the **electronic money** and so forth. Naturally, it is also possible for the cryptographic processing circuit 80-1 to deal with other cryptographic processing such as an elliptic...

...software of the CPU 62-1 to solely perform the cryptographic processing without using a specific circuit as the cryptographic processing circuit 80-1. Encrypted **electronic money** information, transaction log, error information, etc., are stored in the RAM 70-1 functioning as a non-volatile memory with the backup of the battery 74-1. As regards the **electronic money** information stored in the SRAM 68-1, arranged in the memory area are logic IC card storage units corresponding in numbers to the IC cards...

...60-1, for example, 32 logic IC card storage units corresponding to 32 logic IC cards. In this manner, the RAM 70-1 having a **plurality** of card **storage** units for logic IC cards stored therein makes use of a static RAM (SRAM) based on C-MOS technology, so that even though a power supply to the **electronic money** safe 10 has been shut down, only a very

minute current is needed to hold the contents of memory, thereby ensuring the holding of the...

CLAIMS 1. A safe for keeping electronic money representing a currency value in the form of electronic information, said safe comprising:
a non-volatile **memory** having therein arranged a **plurality** of IC card **storage** units corresponding to **storage** units of a **plurality** of IC cards storing said **electronic money** ;
a command control unit for executing concurrently commands imparted to said plurality of IC card storage units arranged in said non-volatile memory to thereby...

...ABSTRACT A2

The **electronic money** managing and possessing apparatus includes a medium (500) for holding an **electronic money** defined as an electronic symbol of currency in a required storage (300) so as to be rewritten when currency of a single kind is used. An **electronic money** distribution and storage control unit (100) is provided for setting a **plurality of storage** areas (301) defined according to individual purposes in the storage (300) of the medium (500) and distributing and storing the **electronic money** in the **plurality of storage** areas (301) according to purposes as instructed and **electronic money** payment executing unit (200). The control unit (100) can thereby allow to specify, regarding the **electronic money** possessed in the medium (500), a desired storage area (301) and executing payment with the **electronic money** stored in this specified storage area (301). Even if currency of only a single kind is used, **electronic money** can be classified and managed according to various purposes. Accordingly, the degree of convenience can be increased for using **electronic money**.

...SPECIFICATION programs to be read by a computer. Based on these programs, the computer can execute a procedure for managing electronic money for various purposes.

The **electronic money** managing and possessing apparatus includes a medium for holding **electronic money** defined as an electronic symbol of currency in a required storage so as to be rewritten regarding currency of a single kind, **electronic money** distribution and **storage** control means for setting a **plurality of storage** areas defined according to individual purposes in the storage of the medium and distributing and storing **electronic money** in the **plurality of storage** areas according to purposes as instructed, and **electronic money** payment executing means for specifying, regarding **electronic money** possessed in the medium, a desired storage area and executing payment by using the **electronic money** stored in the specified storage area.

In the electronic money managing and possessing apparatus, the electronic money distribution and storage control means can include, for ...

...for specifying a desired storage area and storing means for storing the electronic money in the storage area specified by the specifying means.

In the **electronic money** managing and possessing apparatus, the **electronic money** distribution and storage control means can include, for moving **electronic money** possessed in the medium among the **plurality of storage** areas, specifying means for specifying at least one of a storage area as a transfer origin and a storage area as a transfer destination, and moving means for moving the **electronic money** from the storage area as a transfer origin to the storage area as a transfer destination specified by the specifying means.

In the electronic money...electronic money distribution and storage

control means and the electronic money payment executing means to write and read electronic money from the storage area.

The **electronic money** managing and possessing method of the present invention enables **electronic money** to be possessed in a medium by distributing and storing **electronic money** in a **plurality** of **storage** areas according to purposes as instructed, the **plurality** of **storage** areas being defined according to individual purposes in the storing unit of the medium which can hold the **electronic money** defined as an electronic symbol of currency in the required storage so as to be rewritten when currency of a single kind is used.

In...

...money in the medium, a desired storage area may be specified and the electronic money may be stored in this specified storage area.

In the **electronic money** managing and possessing method, for moving the **electronic money** possessed in the medium among the **plurality** of **storage** areas, at least one of a storage area as a transfer origin and a storage area as a transfer destination may be specified and then the **electronic money** may be moved from the storage area as a transfer origin to the storage area as a transfer destination.

In the electronic money managing and...

...the amount of the shortage may be stored in the specified storage area and then the shortage may be settled.

The medium included in the **electronic money** managing and possessing apparatus of the present invention can hold **electronic money** defined as an electronic symbol of currency in a required storage so as to be rewritten. In the **storage** of this medium, a **plurality** of **storage** areas defined according to individual purposes are set when currency of a single kind is used. **Electronic money** is distributed and stored in the **plurality** of **storage** areas according to purposes as instructed.

Furthermore, the present invention provides a recording medium for recording **electronic money** management and possession programs to be read by a computer. This recording medium records **electronic money** management and possession programs for causing the computer to execute an **electronic money** distribution and storage control procedure for distributing and storing **electronic money** defined as an electronic symbol of currency in a **plurality** of **storage** areas according to purposes as instructed, the **plurality** of **storage** areas being defined according to individual purposes in the storage of a medium for holding **electronic money** in the required storage so as to be rewritten when currency of a single kind is used, and an **electronic money** payment executing procedure for specifying, regarding **electronic money** possessed in the medium, a desired storage area and executing payment by using **electronic money** stored in this specified storage area.

With the apparatus and the method for managing and possessing **electronic money**, the management and possession medium, and the recording medium for recording **electronic money** management and possession programs to be read by a computer, which are all provided by the present invention, **electronic money** can be classified and managed according to purposes, even if currency of only a single kind is used, by distributing and storing the **electronic money** in the **plurality** of **storage** areas according to purposes as instructed regarding currency of a single kind and executing payment by using the **electronic money** stored in the desired storage area. Accordingly, we can use **electronic money** feeling as if we are using cash divided ...of calculation performed in the MPU 2, and includes a programmable ROM (PROM).

In other words, the data memory 3 has a function for storing **electronic money**. Specifically, as described in detail later, in the data memory 3, in order to classify and store **electronic money** according to various purposes when currency of a single kind is used, a **plurality** of **storage** areas are formed for storing **electronic money** based on purposes.

...single kind is used.

The storing unit 310 and the storage areas 301 will be described later in detail by referring to FIG. 8.

The **electronic money** distribution and **storage** control unit 100 sets a **plurality** of **storage** areas 301 defined according to individual

purposes in the storage 300 and distributes and stores **electronic money** in the **plurality** of **storage** areas 301 based on purposes as instructed. In other words, the control unit 100 functions as **electronic money** distribution and storage control means. This **electronic money** distribution and storage control unit 100 is equivalent to the MPU 2 shown in FIG. 2.

Specifically, the electronic money distribution and storage control unit...

...specifying a storage area 301 according to the use of the electronic money.

The storage area specifying unit 101 also functions, as described later, when **electronic money** possessed in the **storage** 300 is moved among the **plurality** of **storage** areas 301, as specifying means for specifying at least one of a storage area 301 as an **electronic money** transfer origin and a storage area 301 as an **electronic money** transfer destination (in the embodiment of the present invention, the storage area 301 as an **electronic money** transfer destination is specified).

The storage processing unit 102 functions, when electronic money is read from the foregoing external device and received and stored in...

...for storing the electronic money in the storage area 301 specified by the storage area specifying unit 101.

The movement processing unit 103 functions, when **electronic money** possessed in the **storage** 300 is transferred among the **plurality** of **storage** areas 301, as moving means for moving the **electronic money** from the storage area 301 as an **electronic money** transfer origin specified by the storage area specifying unit 101 to the storage area 301 as an **electronic money** transfer destination.

In the IC card 1000 of the embodiment, when payment is executed by using electronic money possessed in the storage 300 and if...

...to the control unit 21 shown in FIG. 2. The settling unit 104 is equivalent to the operation unit 22 shown in FIG. 2.

The **electronic money** payment executing unit 200 specifies, regarding **electronic money** stored in the storage 300, a desired **storage** area 301 among the **plurality** of **storage** areas 301 and executes payment by using **electronic money** stored in the specified storage area 301. In other words, the executing unit 200 functions as **electronic money** payment executing means. The **electronic money** payment executing unit 200 is equivalent to the MPU 2 shown in FIG. 2.

Specifically, the electronic money payment executing unit 200 includes a storage...

...equivalent to the control unit 21 shown in FIG. 2.

It can thus be understood that the IC card 1000 is a medium for holding **electronic money** defined as an electronic symbol of currency so as to be rewritten in the required storage 300. In the **storage** 300 of the medium, a **plurality** of **storage** areas 301 defined according to individual purposes are set when currency of a single kind is used.

Electronic money is then distributed and stored in the **plurality** of **storage** areas 301 according to purposes as instructed.

To further describe the foregoing storing unit 310 and the storage area 301, specifically, in the storage 300...and starting execution of these programs in the MPU 2 (specifically, by the control unit 21 and the operation unit 22) (see FIG. 2).

The **electronic money** management and possession programs are used to cause the computer to execute an **electronic money** distribution and storage control procedure for distributing and storing **electronic money** in a **plurality** of **storage** areas 301 according to purposes as instructed, the **plurality** of **storage** areas 301 being defined according to individual purposes in a required storage 300 of a medium 500 for holding the **electronic money** so as to be rewritten, and to execute an **electronic money** payment executing procedure for specifying, regarding the **electronic money** possessed in the medium 500, a desired storage area 301 and executing payment with **electronic money** stored in the specified storage area 301.

The electronic money management and possession programs are recorded in, for example a not shown CD-ROM. These...

...1000 feeling as if using cash.

(2) Electronic purse

Referring to FIG. 4 which is a typical view, there is shown an appearance of an **electronic purse**. As shown in FIG. 4, this **electronic purse** denoted by a reference numeral 800 includes a display panel 801, an operation unit 802 and a not shown data **memory**. This data **memory** includes a **plurality** of pockets 301 like those shown in FIGS. 8 and 9. **Electronic money** can be recorded in these pockets.

The IC card 1000 can be inserted and connected to the electronic purse 800. By inserting the IC card...

...of Electronic Money Managing and Possessing Apparatus of the Embodiment of the Present Invention

(b1) Operation of electronic money managing and possessing apparatus

In the **electronic money** managing and possessing apparatus 10 of the embodiment of the present invention, which is constructed in the manner described above in the sub-section (a1), the **electronic money** distribution and storage control unit 100 distributes and stores **electronic money** in the **plurality** of pockets (**storage areas**) 301 according to purposes as instructed, the **plurality** of pockets 301 being defined according to individual purposes in the storage 300 in the medium 500 (IC card 1000 in the embodiment). The **electronic money** payment executing unit 200 specifies, regarding the **electronic money** possessed in the medium 500, a desired pocket (**storage area**) 301 and executes payment by using the **electronic money** stored in the specified pocket (**storage area**) 301.

Next, the functions of the electronic money managing and possessing apparatus 10 of the embodiment of the...

...CLAIMS defined as an electronic symbol of currency in a required storage (300) so as to be rewritten when currency of a single kind is used; **electronic money** distribution and storage control means (100) for setting a **plurality** of **storage areas** (301) defined according to individual purposes in said storage (300) in said medium (500) and distributing and storing said **electronic money** in said **plurality** of **storage areas** (301) according to purposes as instructed; and electronic money payment executing means (200) for specifying, regarding said electronic money possessed in said medium (500)...

...storage area (301) and storing means (102) for storing said electronic money in said storage area (301) specified by said specifying means (101).

3. An **electronic money** managing and possessing apparatus as claimed in claim 1, wherein said **electronic money** distribution and storage control means (100) includes, for moving said **electronic money** stored in said medium (500) among said **plurality** of **storage areas** (301), specifying means (101) for specifying at least one of a storage area (301) as a transfer origin and a storage area (301) as a transfer destination, and moving means (103) for moving said **electronic money** from said storage area (301) as a transfer origin to said storage area (301) as a transfer destination specified by said specifying means (101).

4...

...means (100) and said electronic money payment executing means (200) to write and read electronic money in and from said storage area (301).

9. An **electronic money** managing and possessing method, comprising the step of:

possessing **electronic money** defined as an electronic symbol of currency in a medium (500) by distributing and storing, in said medium (500) for holding said **electronic money** in a required storage (300) so as to be rewritten when currency of a single kind is

used, said **electronic money** according to purposes as instructed in a **plurality** of **storage** areas (301) defined according to individual purposes in said storage (300) in said medium (500).

10. An electronic money managing and possessing method as claimed...

...in said medium (500), a desired storage area (301) is specified and said electronic money is stored in said specified storage area (301).

12. An **electronic money** managing and possessing method as claimed in claim 9, wherein for moving said **electronic money** possessed in said medium (500) among said **plurality** of **storage** areas (301), at least one of a storage area (301) as a transfer origin and a storage area (301) as a transfer destination is specified and said **electronic money** is moved from said storage area (301) as a transfer origin to said storage area (301) as a transfer destination.

13. An electronic money managing...areas (301) defined according to individual purposes in said storage (300) of said medium (500) when currency of a single kind is used, wherein said **electronic money** is distributed and stored in said **plurality** of **storage** areas (301) according to purposes as instructed.

18. A recording medium comprising:

electronic money management and possession programs recorded therein to be read by a computer,

wherein one of said programs is provided for causing said computer to execute an **electronic money** distribution and storage control procedure for distributing and storing **electronic money** defined as an electronic symbol of currency in a **plurality** of **storage** areas (301) according to purposes as instructed, said **plurality** of **storage** areas (301) being defined according to individual purposes in a required storage (300) of a medium (500) for holding said **electronic money** so as to be rewritten when currency of a single kind is used, and another of said programs is provided for causing said computer to execute an **electronic money** payment executing procedure for specifying, regarding said **electronic money** possessed in said medium (500), a desired storage area (301) and executing payment with **electronic money** stored in said specified storage area (301).

...SPECIFICATION card 2 is inserted into the card reader 1 in a step S1 as shown in FIG.4, a step S2 selects one of the **plurality of electronic money files** stored in the IC card 2 in response to a key operation made from the input part 12, and makes a reference to the currency data of the selected **electronic money** file. In addition, in a case where an **electronic money** file which is stored in the IC card 2 and is to be accessed first by an inquiry process is preset to an **electronic money** file related to the currency of the country in which the card reader 1 is set up, for example, the step S2 automatically selects the **electronic money** file related to the currency of the preset country out of the **plurality of electronic money files** stored in the IC card 2, and makes a reference to the currency data of the selected **electronic money** file. A step S3 supplies the referred currency data to the display unit 10, and the currency data is displayed on the display unit 10...10 as shown in FIG.6, for example.

Next, a description will be given of the usage of the IC card 2 which stores a **plurality of electronic money files**. In the case of the IC card 2 which stores the **electronic money** files, each **electronic money** file is a currency file of each country, and the currency data of each **electronic money** file corresponds to the funds of the owner of the IC card 2 in the currency of each country. When using such an IC card

...SPECIFICATION card can control these processes. It may be noted that
each of these CPUs is termed a "control section."

According to the present invention, an **electronic money** card allows
a **plurality** of users to **record** their individual usable limits and
passwords of **electronic money** on a usage basis, and the **electronic**
money card prohibits the use of the **electronic money** in amounts
exceeding the usable limits unless the manager of the **electronic money**
card who has the master password is asked to reset the aggregate amounts
of **electronic money** paid to zero. As a result of the present
invention, a single **electronic money** card can be shared in common
among a plurality of people, and thus the invention contributes to the
promotion of a planned use of the **electronic money** card among family
members or in corporate organizations.

Furthermore, the electronic money stored in the electronic money card
is managed on the basis of a...

CLAIMS 1. An electronic money card for transacting electronic money,
comprising:

a control section (202) and a storage section (205), wherein
the storage section (205) **stores data** of the **electronic money**, a
plurality of pieces of identification data for identifying usages
to be specified when the **electronic money** card is used, and
usable limit data for limiting an amount of **electronic money** to
be used in correspondence with each piece of identification data, and
wherein
the control section (202) compares a piece of identification data
received from...

...ABSTRACT in conjunction with an IC card capable of storing a plurality of different balances relating to commercial transactions. For example, the IC card can provide **separate storage** for **electronic money** information and bonus point information. IC card reading/writing means are provided in the terminal for reading and writing such information stored in said IC card along with input means for inputting transacted sum information and information storage means for storing **electronic money** information equivalent to transacted sum information. In another embodiment, small sum and large sum balances can be separately stored on the IC card, with only...

...SPECIFICATION a customer A and addition of points by 5% in the case of a customer B.

Next, Fig. 4 is a block diagram showing an **electronic wallet** system equivalent to a second embodiment according to the present invention. This is a system for providing, a **plurality** of sum information **storage** in one IC card. These sum information storage are classified into a large sum information storage and a small sum information storage. The large sum...or more sum information storage may be provided and they may be also automatically or manually switched for payment.

In the above embodiment, payment by **electronic money** stored in the small sum information storage is switched to payment by **electronic money** stored in the large sum information **storage** by providing a **plurality** of sum information **storage** in an IC card. However, as shown in Fig. 8, only one sum information storage may be provided in an IC card and the input of personal identification numbers may be also required depending upon a withdrawn sum. However, in this case, since small sums of **electronic money** can be freely withdrawn until the balance stored in an IC card is short, the total amount of the balance stored in an IC card...

...the IC card is used unfairly. Therefore, security can be also provided by automatically requiring the input of personal identification numbers when small sums of **electronic money** are withdrawn by a fixed frequency N. Referring to Fig. 9, the details will be described below. A reference number 22 in Fig. 9 denotes...when the frequency of access to the IC card reaches a fixed frequency N.

In the above embodiments shown in Figs. 4 to 7, a **plurality** of sum information **storage** are classified into a large sum information storage and a small sum information storage, however, they may be also be classified for other purposes of...

...in a pocket A, while money used privately is stored in a pocket B, and they can be readily switched by a user in paying **electronic money**.

For example, a sum information storage dedicated to payment to a specific railroad corporation can be also provided to a plurality of sum information storage...

ABSTRACT EP 950992 A3

The present invention relates to a digital graphic signature system and methods for use in electronic commerce. The system comprises a document portion, including information relating to the document being executed, and a signature portion. The document portion and the signature portion may be encrypted and merged into a single object readily identifiable to an individual. The terminology "digital graphic signature" or "digigraphic signature" is utilized herein to describe the merged object.

The digital graphic signature system of the present invention may be advantageously utilized in electronic transactions, including transactions over the internet and network systems. The digital graphic signature system of the present invention may also be advantageously utilized in conjunction with information banking and **virtual wallets** .

Also disclosed is a digital graphic signet for transmitting a private communication.

ABSTRACT EP 951158 A2

A system and method for controlling the transmission of information known as "cookies" stored on electronic media to Internet websites accessed by PC users utilizes a "cookie jar" in a **server**-based **virtual wallet** for the user. When a website server sends a "cookie" to the user's PC, the **virtual wallet** stores the cookie only after requesting and receiving the user's permission. When the user accesses the website server again, and the server requests return of the cookie, the **virtual wallet** sends the cookie only after requesting and receiving the user's permission. Alternatively, the user can preconfigure the **virtual wallet** with predefined parameters for withholding or sending the cookie when requested by the website server.

ABSTRACT EP 917120 A2
The present invention provides apparatus, methods and systems for
information and financial banking. Apparatus of the present invention
include **virtual wallets** which allow for information and financial
banking including payment mechanisms; identity authentication mechanisms;
personal information; and electronic artifacts. Methods and systems of
the present invention include information and financial banking methods
utilizing **virtual wallets** . A preferred **virtual wallet** comprises a
locally residing portion and a server residing portion. An interface is
provided for communication between the two portions of the wallet.

Where the smart money is in Atlanta

ABSTRACT: The 1996 Olympic games in Atlanta, Georgia, were the venue for the largest ever trial of **electronic money**. The trial was evidence of a global battle for dominance between the 2 largest promoters of electronic cash, Visa and Mondex. Both companies are employing smart cards that have a small chip embedded in them. The chip has a **memory** capacity **many** times greater than present magnetic stripes, which can only store about 200 characters. The bigger memory enables a card to hold different currencies at the...

Abstract: A system is described which captures, stores, processes and records information at the POS. The main unit of the system is a Dual Controller which controls up to 32 terminals, on a time slicing basis. Input is from an **electronic** terminal (**cash** register) which can be located up to 2500 feet away from the dual controllers, these are connected by a 4 wire full duplex signal line. Control is by stored program in a pluggable ROM and MSI logic giving full flexibility with basically standard hardware. Storage is by ferrite core **memory** and cassette tape. **Many** options are available including credit and price files on magnetic disc, data transmission (on or off-line) and optical scanning of bar encoded tickets.

ABSTRACT: Hong Kong and Shanghai Banking Corp. will market an **electronic money storage** card in **several** Asian countries in cooperation with London-based Mondex. The Mondex storage card contains an encoded silicon chip and combines the features of existing automatic teller machine, debit and phone cards. Users simply have to slide the card into special **electronic wallets** or plug into retail inputs to allow currency to change hands within a silicon environment, thus removing the need for cash.

Losses on cards as note use declines
HK Standard, pB3
Sept 19, 1996
Language: English Record Type: Abstract
Document Type: Magazine/Journal; Trade

ABSTRACT:
The potential popularity of **electronic money** could cut the profit on note issues earned by the Hong Kong Monetary Authority (HKMA), said deputy chief executive (banking) David Carse. The authority expected the substitution of currency notes and coins by **electronic money** would be a gradual process. HKMA said the issue of **multi -purpose** stored value cards (MPC) needed to be regulated. It probably will consist of exchange fund bills and notes, providing indirect US dollar backing for the **electronic money** . *

... protection. They are also obsolete.
Max Defreitas
Zapware, Inc.
Houston

Editor's reply: Although our story focused specifically on issues related to new forms of **electronic money** on the Internet, you raise some good points about the safety of online credit-card transactions. Indeed, judging by online buying **habits** so far, **consumers** are more comfortable sending **credit** -card **data** over the Internet than they are using the various modes of digital cash we wrote about.

TEXT:

...Customer loyalty schemes are the key to the future in retail sales, enabling retailers to accumulate and use a host of customer information including, detailed **customer profiles** , what and when they buy and the value of their purchases. So, retailers will be able to reward their

regular **customers** , understand their shopping **habits** , encourage them to spend more and offer a more targeted level of customer service." The launch of VeriFone's SC450 Smart Card reader/writer terminal opens up new opportunities to develop applications beyond customer loyalty. For example, own label debit cards, health care cards, "**electronic purse** " applications, time and attendance schemes and access control. Len Saunders, Managing Director of Saunders Jefferies commented : "We are at the forefront of a retail revolution...
